1 Introduction

2 Preliminaries

2.1 Definitions

As otherwise mentioned, a *graph* $G = (V, E)$ is a tuple consisting of two sets - the set of vertices and the set of edges. An *edge* $e = (v, w), v, w \in V$ is a tuple and describes a connectivity relation between two vertices. Unless otherwise mentioned, the graphs are *undirected*, meaning that the edge (u, v) is identical to the edge (v, u). A *face* is a maximal open region of the plane bounded by edges. The *degree* of a vertex states the amount of edges incident to the vertex. The *degree* of a graph G is the maximum of the degree of its vertices. An *embedding* of G is the collection of counter-clockwise circular orderings of edges around each vertex of V. A *drawing* Γ of a graph G is a function, where each vertex is mapped on a unique point $\Gamma(v)$ in the plane and each edge is mapped on an open Jordan curve $\Gamma(e)$ ending in its vertices. A graph is *planar* if and only if there exists a crossing-free representation in the plane. [1, Page 100]

3 Extensional Work

4 Future Work

5 Acknowledgements

I would like to thank Prof. Michael Kaufmann and Henry Förster for instructing this final thesis. Further I appreciate helpful discussions with Dr. Michalis Bekos. I want to thank especially my parents for their patience and encouragement despite hardest family issues.
